

IELTS Writing Task 1

The pie graphs below show the devices people in the 18 to 25 age-group use to watch television in Canada in two different years.

Answer

The two graphs show how the equipment used by young adults in Canada to view television shows has changed from 2009 to 2019.

Overall, the two pie charts show that TV viewing patterns in Canada have shifted away from older devices and toward more modern alternatives over time.

The switch from traditional televisions to flat displays has been one of the most significant transformations in this decade. The former dropped from 34% to 4% for the period, while the latter increased from 8% to 27%, making it the most popular television device. The latter has supplanted the former as the most widely used television viewing device.

Another general tendency is that, in comparison to 2009, younger people increasingly watch television on smaller, more portable devices. In particular, the usage of mobile phones and tablets for watching purposes has surged by nearly three-quarters to 26%, with tablet use increasing by almost four-fold to 19%. The amount of 18 to 25-year-olds who watch TV on laptops supports this trend. The use of both desktop and laptop computers has decreased significantly (around a third for both).
