

## IELTS Writing Task 1-

The graph below provides information about changes in New Zealand birth and death rates between 1901 and 2101.

### Answer

The graph depicts New Zealand's birth, and mortality rates have shifted from 1901 to 2101.

In all, this negative tendency means that the death rate probably overtakes the birth rate by the year 2041, and in the later half of this century, the enormous difference between the two levels will be reversed.

The birth rate was constantly more significant than the rate of mortality from 1901 to the current day. At the beginning of this time, it stood at 20,000, and in 1961 it reached 66,000. Since then, the rate has ranged between 65 to 50,000, and by the end of the century is predicted to decrease to about 45,000 births gently.

In contrast, the fatality rate began below 10,000 and has progressively climbed till now. Between 2021 and 2051, this rise is projected to be quick if the rate is likely to decrease at about 60,000 before a minor reduction in 2101.
